The **Collarette** Cutting Machines

Making the Best even Better!

Gain improvements in efficiency, quality, ease-of-use and environmental impacts for your cutting room.

Roll-Lifter

Eases operator burden while unloading cut rolls and preserves take-up bar by softening the impact after release.

Festooner

Removes the requirement to stop the collarette cutter to change cut-rolls and allows the sewing operators to also reduce their load times therefore increasing efficiency in both the cutting room and assembly area.

Dust-Phantom

Significant reductions in dust. This leads to less dust and dirt build-up on the machine, cleaner work-environments and cleaner binding production.

High Prefeed

Presents the material, with no tension, to the primary feed device therefore producing a better and more consistent binding.

Pull-out Table for Prefeed Device (option)

True-Drive II

Improvements in synchronization allows for reduction in waste, easier operating procedures allows a single operator to be able to manage multiple machines and finally, production figures are stored so that management can accurately assess both binding output and maintenance schedules.

Slide/load platform for extra wide Frame/Turn-table (option)

Slide Table

An ergonomic improvement that allows the operator to quickly load the folded, tubular material onto the collarette cutter reducing the opportunities for fatigue, injury and expediting the process of loading.

Specifications and appearance are subject to change without prior notice for improvements.
